Dear Hiring Team,

n8n's bet is simple and sharp: give teams a fair-code automation platform they can actually own, then help enterprises put it into production without losing the flexibility that made them choose it. That is exactly the kind of customer-facing engineering I want to do next. I am writing about the Forward Deployed Engineer - EMEA role.

What I bring

- About ten years of Java/Spring backend work, including US large-enterprise delivery: Marsh in Phoenix (Bluestream / Digital Broker for Affinity — ~95,000 colleagues across 130 countries) and BCBSA in Chicago (national hub connecting state Blue Cross Blue Shield plans, ~118 million members system-wide).
- Since early 2026, one of a handful of engineers in an initial core AI team at a large retail-energy company: production AI triage with Azure OpenAI, vector retrieval, and a human approval step before any action, now used by several teams.
- Own agentic software-delivery platform (live): approval-gated agents, RAG with labelled retrieval evals, MCP tool boundaries — public proof that AI systems work can hold up past a demo.

How it fits this role

- Production integrations, APIs, and event-driven backends — the same craft your founding FDE brief describes shipping with customers.
- Hands-on agentic automation from my own platform (approval gates, tool boundaries) plus NRG AI triage adopted by several teams.
- Remote Germany / Europe, English company language, ready to travel for embedded delivery.

I like products where workflow ownership stays with the customer. That matches how I design: deterministic checks where they belong, LLM proposals where they help, and a human gate before action. At this point in my career I want that customer-facing, architecture-adjacent seat more than another pure backend lane.

Enterprises will keep asking for automation they can trust and extend — n8n is built for that, and I want to be the engineer who helps them get there.

Kind regards,

Karthikeyan Devadoss
