Dear Hiring Team,

Oyster's mission — a more equal world by making it possible for companies everywhere to hire people anywhere — depends on hire, pay, and care systems that stay trustworthy at scale. That is why GTM AI here has to redesign how teams operate, not bolt chat onto a spreadsheet. I am writing about the Senior AI Solutions Engineer - GTM role (Remote EMEA).

What I bring

- About ten years of Java/Spring backend work in high-profile US enterprises: Marsh in Phoenix (Bluestream / Digital Broker for Affinity — ~95,000 colleagues / 130 countries) and BCBSA in Chicago (national hub for state BCBS plans, ~118 million members system-wide).
- Since early 2026, one of a handful of engineers in an initial core AI team at a large retail-energy company: designing and shipping production AI triage (Azure OpenAI, vector retrieval, human approval before action) adopted by several teams.
- Independently designed and built a public agentic delivery platform with approval gates, workflow automation, and measurable evals — taking ambiguous problems through to something people actually use.

How it fits this role

- Hands-on AI and automation with cross-functional delivery, not task-level scripting alone.
- Redesigning operating steps (approval-gated agent flows, triage workflows) into measurable business impact.
- Based in Berlin / EMEA, English day-to-day, and experienced working across time zones with US stakeholders from Marsh and BCBSA.

Build and Give Trust, Make It Happen, Drive Change, and United Team match how I deliver: careful handling of sensitive healthcare and insurance data paths, ownership when the problem is still fuzzy, and cross-functional follow-through. At this stage I want a solutions seat next to GTM and architecture, building automation that earns trust while it scales.

Companies everywhere hiring people anywhere only works if the automation behind it earns trust — that is Oyster's purpose, and it is the kind of GTM systems work I want to do next.

Kind regards,

Karthikeyan Devadoss
