Dear Hiring Team,

Moss is modernising how companies control spend — and Applied AI here means shipping agent features that change how finance teams work, not bolting a chatbot onto yesterday's process. Berlin hybrid, end-to-end ownership: that is the shape of role I am aiming for. I am writing about the Applied AI Engineer role.

What I bring

- About ten years of Java/Spring backend work, including US large-enterprise delivery: Marsh in Phoenix (Bluestream / Digital Broker for Affinity — ~95,000 colleagues across 130 countries) and BCBSA in Chicago (national hub connecting state Blue Cross Blue Shield plans, ~118 million members system-wide).
- Since early 2026, one of a handful of engineers in an initial core AI team at a large retail-energy company: production AI triage with Azure OpenAI, vector retrieval, and a human approval step before any action, now used by several teams.
- Own agentic software-delivery platform (live): approval-gated agents, RAG with labelled retrieval evals, MCP tool boundaries — public proof that AI systems work can hold up past a demo.

How it fits this role

- Shipped production LLM capability with evaluation and a human-approval boundary; comfortable owning accuracy, latency, and UX tradeoffs.
- Strong Python/Java backend and API background for integrating agents into real services and data paths.
- Based in Berlin; English day-to-day; experience taking ambiguous problems from design through adoption.

Spend and finance systems only earn trust when automation is careful with money and permissions. That is how I already design AI paths: clear capability boundaries and approval before action. At this point in my career I want that customer-facing, architecture-adjacent seat more than another pure backend lane.

If Moss is going to make AI part of how finance teams actually operate, I want to help build the features that prove it.

Kind regards,

Karthikeyan Devadoss
